

No Hyperscale Data Centers IN FLORIDA

THE CASE FOR A BAN

Why Ban Hyperscale Data Centers?

Florida's land, water, and power are not unlimited.

Hyperscale data centers place enormous, permanent demands on the resources our communities depend on. Once farmland is converted and infrastructure is built, there is no going back.

THE CORE CONCERNS

- ✓ **Land:** Massive facilities lock hundreds of acres into industrial use for decades.
- ✓ **Water:** Cooling demands can compete with drinking water, farms, and Florida's aquifers and springs.
- ✓ **Electricity:** Grid upgrades built for one giant customer are paid for and shared across everyone's bills.
- ✓ **Agriculture:** Productive farmland, once converted, rarely returns to production.
- ✓ **Quality of life:** Around-the-clock noise and industrial traffic change the character of a community.

Counties should decide whether developments of this scale are compatible with existing neighborhoods, agricultural areas, and natural resources — before projects are already underway.

The answer for Florida is simple.
Ask your commissioners to protect your county.
